

SquadSpeak

Real-time voice translation for competitive gaming

Windows desktop app · Offline · Sub-second latency · CS2, Valorant, Apex

THE PROBLEM

Ranked lobbies are global. Voice comms aren't.

Language mismatch

Random teammates speak different languages. Callouts, strategy, and warnings get lost.

No good workaround

Phone translators are slow and disruptive. Discord bots add latency and require cloud access.

Competitive cost

In ranked play, one missed callout can mean a lost round — and a lost rank.

WHY NOW

Two forces are converging

Global matchmaking is the norm

CS2, Valorant, and Apex fill lobbies from dozens of countries. Mixed-language stacks are now the default, not the exception.

On-device ML is finally viable

Whisper and local translation models now run in real time on consumer GPUs — no cloud, no latency penalty, no privacy tradeoff.

THE SOLUTION

Capture voice. Show subtitles. Stay in the game.

SquadSpeak is a Windows desktop app that listens to in-game voice chat, transcribes it with Whisper, translates it locally, and displays live subtitles as an overlay — all without leaving the game or connecting to the cloud.

→ Offline by design

→ Sub-second latency

→ Privacy-first — no audio leaves your machine

HOW IT WORKS

Four steps, zero friction

The entire pipeline runs on the user's GPU. No API calls, no cloud dependency, no added network latency. Launch the app, join your match, and subtitles appear automatically.

PRODUCT

v1.0 MVP — shipped and running

Supported titles

CS2, Valorant, Apex
Legends — with more
on the roadmap.

Language coverage

Multi-language
transcription and
translation via
Whisper + local NMT
models.

Overlay system

Non-intrusive on-
screen subtitles
rendered above the
game window, fully
configurable.

IDEAL CUSTOMER PROFILE

Ranked players who can't afford miscommunication

Who they are

Competitive PC gamers in ranked lobbies — Gold to Immortal — playing CS2, Valorant, or Apex multiple times per week.

Their pain

Regularly matched with teammates speaking a different language. Missed callouts cost them games and rank.

Their behavior

Already spending on gaming peripherals and software. Willing to pay for a competitive edge that actually works.

TRACTION

Early momentum, real validation

v1.0

Shipped

Working MVP deployed to early users

3

Games supported

CS2, Valorant, Apex Legends at launch

0

Cloud dependency

Fully offline, privacy-preserving architecture

 Selected for **Georgia Tech CREATE-X Pre-Accelerator** — structured mentorship and customer discovery underway with target users.

Active customer discovery interviews in progress. Beta waitlist growing organically through gaming communities and university esports channels.

No one owns offline, in-game translation

Existing solutions force a tradeoff: speed vs. privacy vs. integration. SquadSpeak is the only option that delivers all three — running entirely on-device, inside the game, with no cloud round-trip.

- **Defensibility:** Deep integration with game audio pipelines and on-device ML optimization creates a technical moat that cloud-based competitors can't easily replicate.

THE ASK

What we need to get to validation

Beta Testers

Competitive gamers in mixed-language lobbies to stress-test latency, accuracy, and UX before public launch.

Gaming Industry Mentors

Advisors with distribution, publishing, or esports experience to shape go-to-market and partnership strategy.

Fundraising After Validation

Targeting a pre-seed raise post-beta with validated retention and willingness-to-pay data from real users.
